

Hydromorphone, Idromorfone

Printed from <https://www.cancerquest.org/patients/drug-reference/hydromorphone-idromorfone> on 06/03/2026

Brand name: Dilaudid®

IUPAC: 4,5 alpha-epoxy-3-hydroxy-17-methyl morphinan-6-one

FDA approval: Yes

[Manufacturer Link](#)

Usage:

Hydromorphone is an opiate related to morphine that helps to relieve pain. Hydromorphone can be given as a tablet, liquid, injection or suppository, usually several times daily. [1](#)

Side effects:

Side effects include : sedation or drowsiness, nausea and vomiting may become a problem at high doses and constipation with prolonged use. Hydromorphone can be habit-forming. Psychological and physiological withdrawal symptoms can occur if the patient becomes drug-dependent. Higher doses maybe needed to achieve pain relief because patients may build tolerance to the drug. Patients should avoid alcohol consumption while taking hydromorphone because it may intensify some of the mental and emotional side effects of hydromorphone, such as drowsiness and changes in mood. Hydromorphone can cause respiratory depression. This may result in a potentially dangerous slowing of a patient's breathing rate. [1](#)
