Contraindications:

Oxycodone can cause respiratory depression. This may result in a potentially dangerous slowing of a patient's breathing rate. Oxycodone can be habit forming. Psychological and physiological withdrawal symptoms can occur if the patient becomes drug-dependent. With prolonged use, tolerance may also become a problem, requiring higher dosages to achieve pain relief. Alcohol can intensify some of the mental and emotional side effects of oxycodone, such as drowsiness and changes in mood. Patients should avoid alcohol consumption while taking oxycodone.¹
