

# Thalidomide

Printed from <https://www.cancerquest.org/patients/drug-reference/thalidomide> on 02/16/2026

Brand name: THALOMID®

IUPAC: 2-(2,6-dioxopiperidin-3-yl)isoindole-1,3-dione

FDA approval: Yes

[Manufacturer Link](#)

Usage:

THALOMID®, in combination with dexamethasone, is indicated for the treatment of patients with newly diagnosed multiple myeloma. Thalidomide is also FDA-approved for treatment of ENL and MDS.[1](#)

Mechanism:

The mechanisms that characterize this antiangiogenic agent are not fully understood, however it is known that Thalidomide inhibits TNF alpha synthesis. In addition to this, Thalidomide may also exert antiangiogenic effects, which inhibit BFGF and VEGF.[1](#)

The diagram below shows the 3D molecular structure of Thalidomide.
