

Decitabine

Printed from <https://www.cancerquest.org/patients/drug-reference/decitabine> on 07/27/2024

Brand name: Dacogen®

FDA approval: Yes

[Manufacturer Link](#)

Usage:

Decitabine is approved to treat myelodysplastic syndromes (MDS) of many different subtypes and is only administered intravenously. Patients are often premedicated with anti-nausea medications in order to limit poor reactions post-treatment. Decitabine may cause severe reactions affecting the lungs, heart, brain, liver and bilirubin.¹

Mechanism:

Decitabine (Dacogen®) is a nucleoside analog that incorporates directly into DNA and is believed to inhibit DNA methyltransferase. This may function in cancer cells to restore normal function to genes necessary for the control of cell proliferation and promote apoptosis of damaged cells.¹

The molecular structure above shows the 3D conformer Decitabine.
