

Mercaptopurine (6-mercaptopurine or 6-MP)

Printed from <https://www.cancerquest.org/patients/drug-reference/mercaptopurine-6-mercaptopurine-or-6-mp> on 06/22/2026

Brand name: Purinethol®

Brand name: Puri-Nethol®

IUPAC: 3,7-dihydropurine-6-thione

FDA approval: Yes

[Manufacturer Link](#)

Usage:

The purine antagonist 6-Mercaptopurine has been used as a chemotherapy drug for over 30 years. The drug is usually given orally. When higher doses are required, the drug may be given through an IV. Patients suffering from acute lymphocytic or myelocytic leukemia, lymphoblastic leukemia (especially in childhood cases) and acute myelogenous and myelomonocytic leukemias are often given 6-MP (Purinethol®, Puri-Nethol®) in combination with other chemotherapy drugs. In addition to its role in cancer treatment, 6-MP is used to treat patients suffering from a variety of inflammatory bowel diseases. The drug is also used to prevent rejection following organ transplants. [1](#)

Mechanism:

6-MP is very similar to the purine bases in DNA. When used in DNA replication (copying), it prevents cell division. This also leads to inhibition of DNA synthesis and function, as 6-MP incorporates thiopurine nucleotides. 6-mercaptopurine (6-MP) causes remissions in childhood leukemia cases without severely harming normal cells. Side effects:

Side effects include low blood counts (Myelosuppression), mouth sores, diarrhea, skin rash/acne, mild nausea, abnormal liver function. Side effects are rare in children. [1](#)
