

Temozolomide

Printed from <https://www.cancerquest.org/patients/drug-reference/temozolomide> on 02/15/2025

Brand name: Temodar®

IUPAC: 3-methyl-4-oxoimidazo[5,1-d][1,2,3,5]tetrazine-8-carboxamide

FDA approval: Yes

[Manufacturer Link](#)

Usage:

Temozolomide (Temodar®) is an alkylating agent used primarily to treat refractory brain tumors (astrocytomas) in adult patients. It may also be used in the treatment of metastatic melanoma and glioblastoma multiforme (GBM). Temozolomide is administered in capsule form.¹

- ¹Chu, E., & DeVita, V. T. (2015). Physicians' cancer chemotherapy drug manual 2015. Burlington, MA: Jones & Bartlett Learning.

Mechanism:

Temozolomide is a non classic alkylating agent that creates fragmented DNA and prevents DNA and RNA protein synthesis. Different from other drugs, Temozolomide does not inhibit through cross-linking with DNA.¹

The diagram above shows the 3D molecular structure of Temozolomide.
