

# Amifostine

Printed from <https://www.cancerquest.org/patients/drug-reference/amifostine> on 06/26/2026

Brand name: Ethyol

IUPAC: 2-[(3-aminopropyl)amino]ethanethiol dihydrogen phosphate (ester)

FDA approval: Yes

[Enlace del fabricante](#)

Usage:

Amifostine is injected intravenously in the hospital just prior to the administration of radiation treatment or chemotherapy. Amifostine is used in a wide variety of cancers in order to reduce nausea during chemotherapy treatments.

Mechanism:

Amifostine is a cytoprotectant, which are used as additional medications to protect against the harms of main treatment.<sup>1</sup> Amifostine is used in conjunction with chemotherapy agents (Ex: Cisplatin, Cyclophosphamide and Paclitaxel) to reduce their nephrotoxic and neurotoxic effects that cause fever and infection.<sup>2</sup>

The molecular structure below shows the 3D conformer Amifostine.
