

Vincristine sulfate liposome injection

Printed from <https://www.cancerquest.org/patients/drug-reference/vincristine-sulfate-liposome-injection> on 02/24/2026

Brand name: Marqibo®

FDA approval: Yes

[Enlace del fabricante](#)

Usage:

Marqibo® (Vincristine sulfate liposome injection) was approved by the FDA in 2012. It is used to treat adults with Philadelphia chromosome negative (Ph-) acute lymphoblastic leukemia (ALL), a rare type of leukemia. This drug is used in patients whose leukemia has relapsed/returned 2 or more times or whose disease has progressed after 2 or more anti-leukemia therapies.[1](#)

Mechanism:

Vincristine sulfate liposome injection (Marqibo®) is a sphingomyelin/cholesterol liposome-encapsulated form of a vinca alkaloid. The liposome capsule is made from materials similar to that of cell membranes and serves as a drug delivery vehicle for vincristine sulfate. To be active, the vinca alkaloid must be released from the liposome. Non-liposomal vincristine sulfate binds tubulin and alters tubulin polymerization, disrupting normal microtubule structure and function. Non-liposomal vincristine sulfate stabilizes the spindle apparatus and prevents chromosome segregation, inhibiting metaphase and mitosis.[1](#)
