

Fat and cholesterol shown to increase prostate cancer risk and progression of prostate cancer.

Printed from <https://www.cancerquest.org/newsroom/2010/12/fat-and-cholesterol-shown-increase-prostate-cancer-risk-and-progression-prostate> on 10/14/2025

Thomas Jefferson University researchers have shown that a 'Western-type' diet, high in fat and cholesterol, can increase the risk of prostate cancer and accelerate cancer growth and progression. The TRAMP mice used are pre-disposed to getting prostate cancer but the mice fed a fat/cholesterol rich diet developed cancer more quickly and the tumors grew and progressed at an accelerated rate.
