

Tumors prepare distant sites for metastatic growth.

Printed from <https://www.cancerquest.org/newsroom/2011/03/tumors-prepare-distant-sites-metastatic-growth> on 10/24/2025

The spread (metastasis) of cancer to distant locations is responsible for about 9 out of 10 cancer deaths. It is very important that we understand how and why a cancer spreads to particular locations. New research shows that tumors can prepare a site for metastasizing cells before the cells even leave the tumor. By activating an enzyme in the lungs (focal adhesion kinase; FAK), the original (primary) tumor caused the alteration of blood vessels in parts of the lungs, making it easier for cancer cells to enter those locations and form secondary growths (metastases).
