

Tumors act like ancient multi-celled organisms.

Printed from <https://www.cancerquest.org/newsroom/2011/02/tumors-act-ancient-multi-celled-organisms> on 04/26/2026

A new theory about the behavior of cancer cells proposes that the development of the disease is dependent on ancient sets of genes that evolved early in the development of multicelled organisms. The authors suggest that the relatively undifferentiated and loose organization seen in tumor cells is similar to what would have been present in early forms of multicellular (metazoan) life. The theory, if correct, could have important implications on the ways that cancer develops.
