# HIV Drug May Prevent Cervical Cancer

Printed from https://www.cancerquest.org/newsroom/2011/05/hiv-drug-may-prevent-cervical-cancer on 11/14/2026

Globally, cervical cancer is a leading causes of cancer death, killing almost 300,000 women yearly.  New research shows that a commonly used HIV/AIDS drug, lopinavir, can kill cervical cancer cells and non-cancerous HPV immortalized cells. The identification of an approved drug that can kill pre-cancerous cervical cells is an exciting breakthough.  The researchers hope to begin testing of an ointment for the prevention of cervical cancer.
