Palbociclib

Printed from https://www.cancerquest.org/node/6370 on 12/01/2025

Brand name: Ibrance

IUPAC: 6-acetyl-8-cyclopentyl-5-methyl-2-[(5-piperazin-1-ylpyridin-2-yl)amino]pyrido[2,3-d]pyrimidin-7-one

FDA approval: Yes Enlace del fabricante

Usage:

Palbociclib is administered in pill form and is used in combination with hormonal therapy to treat HER2- metastatic breast cancer. $\underline{\mathbf{1}}$

Ibrance comes in a capsule form and is taken once a day with food.

Mechanism:

In conjunction with a hormonal therapy, Palbociclib works as a targeted CDK4/6 inhibitor, which controls cancerous cell growth by reducing a cell's progression through the cell cycle. This interruption in a cell's cycle keeps it from growing and keeps cancer from spreading.1

Ibrance works by inhibiting molecules, known as cyclin-dependent kinases (CDKs) 4 and 6, involved in promoting the growth of cancer cells. Ibrance is intended for postmenopausal women with estrogen receptor (ER)-positive, human epidermal growth factor receptor 2 (HER2)-negative metastatic breast cancer who have not yet received an endocrine-based therapy. It is to be used in combination with letrozole, another FDA-approved product used to treat certain kinds of breast cancer in postmenopausal women.

The diagram below shows the 3D molecular structure of Palbociclib.
