

E-cigarettes Found to Damage the Circulation

Printed from <https://www.cancerquest.org/newsroom/2017/08/e-cigarettes-found-damage-circulation> on 05/16/2026

A new study, published by researchers from West Virginia University in August of 2017, suggests that any amount of exposure to e-cigarette vapor may be enough to damage blood vessel function. After 5 minutes of exposure to an e-cigarette, the arteries of the group of mice closed by 30 percent. After exposing the long-term group of mice to 20 hours of e-cigarette vapor per week for 8 months, the mice showed effects of aortic stiffness and damage to blood vessel function. Aortic stiffness is a complication in the heart's main artery, and is an indicator of cardiovascular disease.¹
