100 percent in text

A small cancer clinical trial gave historical results. Every patient in the trial had a complete remission of their rectal cancer. The 12 patients received a treatment, dostarlimab, every three weeks for six months. The treatment is designed to activate the patient's own immune system to fight cancer. Dostarlimab is one of a group of drugs called 'checkpoint inhibitors'. They all work to prevent cancer cells from shutting down the immune system. In this case, the results were outstanding - EVERY patient went into remission and had no evidence of disease. Only time will tell if they are cured, but this is an amazing and exciting result!
