While cancer treatments have progressed, little is known about their long-term effects on functioning. Cancer related cognitive impairment (CRCI) is an obstacle for many survivors as they are transitioning from life with cancer to life in remission. While the physical body has healed, there is little attention placed on healing the mind. This is an important topic because many people have undergone cancer treatment and have been affected by this. The purpose of this study is to examine the effects of cancer treatments on long-term psychological health and mental functioning. By gaining a better understanding of cognitive impairment following cancer treatment, doctors will be better able to treat and educate current cancer patients.

Are you eligible?

- 18 – 65 years of age
- Fluent in English
- Been diagnosed and treated for a non-central nervous system cancer within the past 10 years
- In remission for over one year

The survey takes around 20-30 minutes to complete and is available 24/7 for your convenience. If you have any questions about the study, please contact the principle researcher. If you are eligible and interested in participating, please type this link into your internet browser:
